Hints for Dynamic QR Code Generation Challenge

Hints for Implementing the QR Code Generation Challenge:

1. Pre-generating the QR code on page load:

   - Use the `DOMContentLoaded` event to trigger QR code generation.

2. Designing the download functionality:

   - Capture the QR code from the canvas and convert it to an image format.

   - Create a cart-like graphic design in canvas or image format for the download.

3. Enhancing user experience:

   - Ensure the QR code includes a clear and inviting message.

   - Make the QR code download visually appealing and aligned with the restaurant's branding.

Document each function clearly to explain its purpose and usage to future developers or maintainers.
